

THE BROWARD COUNTY LEAGUE OF CITIES'  
SCHOOL AND COMMUNITY PUBLIC SAFETY  
TASK FORCE

INITIAL REPORT AND RECOMMENDATIONS

June 4, 2018

Exhibit #35

Date: May 8, 2018

To: Bertha Henry, County Administrator, Broward County

From: Frank Babinec, President, Fire Chiefs Association of Broward County  
Howard Harrison, President, Broward County Chiefs of Police  
Stephen Kinsey, Undersheriff, Sheriff's Office of Broward County

CC: Alphonso Jefferson, Jr., Assistant County Administrator  
Brett Bayag, Acting Director, ORCAT

Reference: Countywide Communications

The Fire Chiefs Association of Broward County, which represents all of the fire rescue departments in Broward County, the Broward Sheriff's Office, representing BSO Law and BSO Dispatch operations, and the Broward County Chiefs of Police Association who represent --- agencies in Broward County, are committed to moving forward to achieve the highest level of communications in Broward County. There are 19 different fire agencies providing fire, rescue, EMS and special operations services to the residents and visitors of Broward County and 18 different police departments protecting and serving our great county. All of our agencies depend heavily on the Countywide Communications infrastructure to provide the lifesaving services they provide. The Countywide Communications System, our most vital link in the provision of Fire-Rescue and Police services to the citizens and visitors of Broward County, is outdated and in a perilous state. Following the May 8, 2018 County Commission Meeting, it is evident that we all agree the radio system is at its end of life and needs to be replaced as soon as possible.

When we look at countywide communications, there are 5 different PSAPs in Broward County, operated by three separate agencies. Their functions can be divided into 5 buckets. The radio system (there are several different systems), the CAD (there are 3 different CADs), the 911 phone system (the same for all), the operators that run the centers (there are 3 different entities running operations) and the fire stations' alerting system.

The 2015 Mission Critical Partners comprehensive report commissioned by Broward County looked at several facets of the communications infrastructure. The report details a radio system that had reached the end of its useful life and was in need of replacement.

The Broward County radio system's shortcomings, mostly due to its age, are well documented in the 2015 report. The consequences of immediate inaction are being experienced by first responders on a daily basis.

Recent events such as the Ft. Lauderdale Airport Shooting and the Marjorie Stoneman Douglas High School tragedy have highlighted an antiquated radio system's inability to perform to the levels needed by first responders during high demand incidents.

As noted in the 2015 report, the radio system reaches its capacity on a daily basis due to the number of emergency and non-emergency users on the system, as well as improperly maintained equipment. At the May 8, 2018 County Commission meeting, the system's inability to perform at the levels to which first responders needed at the above mentioned events, was heavily blamed on the end users, specifically a lack of training by the end users. BSO, and the Fire and Police Chiefs Associations do not dispute the need for refresher training by the end users, and we now understand the need for preventative maintenance on the mobile and portable radios. We strongly feel that there is more to the shortcomings of the system that were not acknowledged by ORCAT. We are troubled that ORCAT took very little to no responsibility, and instead the lion's share of the blame was put on the fire and police personnel.

The Fire Chiefs Association of Broward County, BSO, and the Broward County Chiefs of Police Association and its members believe there exists a lack of planning, a lack of oversight, a lack of funding, and no clear vision for one of the most important components of public safety. The current radio communications system was put into service in 1992, updated in 2002; the system is more than two decades old and should not be expected to perform to today's demands.

Motorola engineers have identified that a large number of users attempting to access the system has caused an effect known as "throttling". When access requests exceed the capacity of the controller's buffer, the controller denies further affiliation attempts until the buffer is cleared. This results in system busy tones and/or "NO COMMS" error messages received by those attempting to access the system.

The approach to keeping the out-of-date radio system operational, as well as other components of the countywide communications system thus far has been fragmented, focusing on just keeping things going rather than what is needed to have a system that will operate to levels needed by the end user. There have been committees such as the CCCC and ORT committee with little or no measurable success. Representatives of the both Associations and BSO to these committees have reported frustration on the inability to get things done.

As we know, communications is a necessity for safe and adequate emergency operations throughout the county, and both Associations and BSO feel a regional approach is most appropriate to ensure all components are interoperable and maintained for optimal performance. The Fire Chiefs Association of Broward County, BSO, and the Broward County Chiefs of Police Association are committed to working with all stakeholders to help in any way possible to achieve a system that will truly serve the community at the level it deserves.

However, we continue to run into roadblocks. The Fire Chiefs, for example, believe critical communications equipment is being held hostage until the Fire Chiefs Association of Broward County delivers a written agreement on closest unit response. This equipment, the Mobile Data Terminals, are needed by the firefighters and EMS personnel to do their jobs and should never be used as a bargaining chip.

Both associations realize that the radio system in use today is old and well past its end of life. We realize that there is a need for maintenance and training by the end users. We realize Broward County is currently in the process of implementing the newly designed radio system that is supposed to be operational by the 4th quarter of 2019. ORCAT needs to realize that the first responders on the street need dependable equipment that is going to meet their needs, keep them safe, and meet the needs of the community. We all need to understand what is being done or what can be done to ensure the current radio system doesn't collapse prior to implementation of the new radio system.

In a meeting on May 3, 2018, that consisted of representatives from the Fire Chiefs Association of Broward County, BSO, the Broward County Police Chiefs, Plantation Communications, BSO Communications, Broward County Administration and ORCAT, we were advised that a large number of users attempting to access the new system may cause this same effect known as "throttling".

At the May 8, 2018 County Commission meeting, ORCAT stated in reference to the new system, "This system, though state of the art, will reach its maximum capacity and resort to its fail safe mode, if used improperly, making it imperative that users learn how to use the radio system efficiently and effectively". During the meeting it was alluded to that first responders should scale back the use of the radio system during large scale incidents. This is not practical, but a great impediment to the proper handling of a large scale incident. The system needs to be designed to handle the demands of the county during multiple large scale events occurring at the same time.

BSO and both Associations seek a system-wide approach, led by a subject matter expert, with the experience, ability, authority, and resources to ensure the citizens, visitors, and first responders have a communications infrastructure they can depend on to receive and relay critical lifesaving information.

Although the radio system has already been built and purchased, prior to installation **it would be extremely beneficial to get all the stakeholders together**, sooner rather than later, one last time. As the County Administrator stated, the system is expected to last 25-plus years, so we need to make sure we get it right from the beginning.

Moving forward, the Fire Chiefs Association of Broward County, BSO, and the Broward County Chiefs of Police Association are committed to working together to implement a system that serves all of us to the highest level. The following are some action items that we need to get answers to, or follow up on:

1. **After Action Report** – All stake holders must be involved in the after action report being prepared for the county. This way communications will be represented from an operational stand point and not just a technical stand point.
2. **SmartZone system components** – specifically, the prime controller and site controller are no longer supported. As this has been identified as a prime area of concern (reference "throttling"), ***Can we replace it immediately regardless of whether or not it is compatible with the new P25 system?***
3. **Maintenance of existing subscriber units** – Overall, this has been inconsistent causing them to affiliate to the system much more than normal; thereby affecting reliability and causing outages in the system controller. ***Has this been mitigated or resolved?***

4. **SmartZone capacity limit** – the system approaches capacity limit (more than desired) during peak usage hours (morning – evening), especially due to the number of users on the system (with school board usage being one of the identified users); ***What can be done to reduce this usage to temporarily increase capacity until a permanent solution is in place?***
5. **Single points of failure** – MCP notes that this design can leave first responders with no way to communicate; ***Have all options been exhausted to retrofit existing points of connectivity, site controller locations, and single site controllers to attempt to change this (even temporarily)?***
6. **Subscriber Units** – At the time of the analysis, MCP estimates that 10,427 primary subscriber radios are currently on system; with additional estimates having another 3,000 to 4,000 subscriber radios programmed with the ability to access the system for interoperability; ***Is the new system designed for this level of capacity?***
7. **Back-up** – Is there a plan to use Coral Springs and Plantation as true backups and vice versa?
8. **In building coverage requirements** – have we established any guidelines regarding the use of additional BDA's, mobile and/or fixed repeaters, to help bridge the coverage gap? Has any contact been made with entities such as the Hospital District(s) or School Board regarding the issues within their buildings?
9. **Static back up system for redundancy** – Is one being configured and if so, how? What is the status of the 4-RDSTFD locations related to the Region 7 700 MHz system? MCP recommended that the County proceed with implementing the RDSTF 700 MHz overlay system as a stand-alone trunked P25 Phase I location for backup capability – was the procurement of this system authorized and completed prior to the end of 2015 (as recommended)? A fixed / dedicated solution was recommended to ensure immediate availability; with supplemental components such as mobile, conventional repeaters.
10. **Non public safety users** – are all non-public safety users being removed from the new 700 MHz frequencies?
11. **Future use of the 800 MHz frequencies** – will they still be available for use within the new system, regardless of whether or not the current design calls for its use? Would current and future tower sites be capable of housing/supporting both systems and the necessary equipment?

12. **End of life replacement schedule (pre-determined)** – MCP notes that even new equipment will have both predetermined and recommended end-of-life dates. Is there a plan in place to require the procurement and replacement of these pieces of equipment to ensure the new system does not suffer like the current one is in dealing with non-supported, non-functioning communication equipment?
13. **Microwave system status** – MCP recommended replacement of current system prior to the system cutover; what is the status?
14. **Paging system** – current system has a single controller resulting in a single point of failure. MCP recommends redundant controllers for new the system to mitigate this; is that recommendation being built into the newly designed paging system?
15. **Fort Lauderdale / Hollywood and their current system design with the newly proposed Regional Design** – MCP mentions the use of the current hosted master site and its interoperability with both Fort Lauderdale and Hollywood, including the Phase 1 subscriber units; is this still a concern and if so, how is it being handled?
16. **UHF frequency status for paging / station alerting** – have the identified frequencies been secured for these items?
17. **Maintenance Plan** – MCP recommends a mandatory preventative maintenance program that requires a retune every other year for subscriber units to prevent issues in the system; how is that being handled and by whom?
18. **Transition between current system to new system** - MCP mentions issues with Phase I vs Phase II subscribers regarding system capacity with Phase I subscribers using the system until the unit is changed to a Phase II compatible subscriber unit; is this still a concern and if so, how is it being handled?
19. **Radio ID's** - Can a list of the radio ID's and associated jurisdiction that were the main contributors to the alledged problems at the airport and MSD, be provided to include school board and local government?
20. **Local Government System** - When will the local government system be ready? Is there a delay? If so, what is that delay?
21. **School Board** - If the school board users prove to be a problem, can they be off-loaded to a commercial system now? If not, why?
22. **Talkgroups** - Are talkgroup priorities set in the new system to allow Main channels and tactical channels to connect?

23. **Design** - Did the design consultant consider a two or three controller system, North/South, Main/Tactical, Law/Fire or any other combination/consideration on the new system?
24. **Compliance** - Does the new system comply with NFPA 1221 with regard to having non-trunked conventional or simplex channels for tactical operations? Non-trunked/conventional channels do not need a controller.
25. **Training** - When will formal training be provided by the County for the end users?
26. **MDTs** - What is the replacement plan for the mobile data terminals?
27. **Tactical Communications Plan** - In the August 15, 2017 After Action Report "Active Shooter Incident and Post-Event Response January 6, 2017", issued by Broward County, Recommendation Item 1.1.1.5 states: "Consider developing a Tactical Communications Plan for first responders during high-volume events when radio and cell phones are busy, not working or overwhelmed." This is related, obviously, to the "throttling issue" briefly discussed therein. Can you please provide a copy of this plan.
28. **SOPs** - Please provide a copy of the County's current SOP on governing the use of the radio system.

BERTHA W. HENRY, County Administrator

115 S. Andrews Avenue, Room 409 • Fort Lauderdale, Florida 33301 • 954-357-7362 • FAX 954-357-7360

451 NW 70<sup>th</sup> Terrace  
Plantation, FL 33317

**Subject: Response to Joint Letter from the Fire and Police Chiefs' Associations and  
Broward Sheriff's Office dated May 8, 2018**

Dear Chiefs:

As you are aware, the County has engaged the Police Foundation, Inc. to holistically review the community's response to the incident that occurred at Marjory Stoneman Douglas High School on February 14, 2018. The goal of the County's After-Action Report is to consolidate the various individual assessments into a communitywide assessment; look for any gaps in preparedness; and offer a report that accentuates our strengths while providing best practice strategies to close any gaps that are identified.

One of the first tasks for the Police Foundation will be to review the performance of the County's radio communications system during the incident. Data and user activity from the radio system has been provided to the Police Foundation's communications expert to help us better understand any system deficiencies, end user training needs, and any other factors contributing to the challenges faced in communications that day. To assist with this review, we are requesting copies of the policies and standard operating procedures, and training records currently in place by each agency regarding radio usage, placing emphasis on those that relate to mass incidents. If available, we would also like to request copies of the radio preventative maintenance programs, including when each radio received their last preventative maintenance. Your assistance with collecting this information will be much appreciated as it will be essential in enhancing any training that may be necessary. The goal is to review and update, not replace, existing policies to ensure they cover the essential elements for proper radio use.

In the interim, we are working with Motorola and Mission Critical Partners (MCP) to determine if there are stop gap measures that can be implemented until the new system and protocols are in place. In either case, offering first responders this one basic tip will assist greatly: every push of the button or

Broward County Board of County Commissioners

[www.broward.org](http://www.broward.org)

twist of the channel control knob has an impact on the radio system's resources and can impact communication. Limiting or avoiding such actions by those not responding to and/or working the incident will serve to improve radio system performance during a mass incident.

Based on your letter to Brett Bayag dated May 8, 2018, received on May 15, 2018, I would like to address some key points and respond to your comments.

### **Public Safety Radio System Replacement**

As you are aware, the County embarked on replacing the Public Safety Radio System by engaging Mission Critical Partners (MCP) to conduct a comprehensive radio system assessment and analysis, and gain feedback from end users. Please recall letters to the Police and Fire Chiefs' Associations dated December 28, 2015 and January 19, 2016. Both these letters addressed various issues raised by each Association. End-user feedback was utilized in the design of the new system. Both Associations were directly involved in the development of the new system's specifications; consisted of the majority technical review committee makeup for field demonstrations; provided specific vendor demonstration requirements; and were included on the committee tasked with vendor selection (Motorola) to replace the legacy system.

The occurrence of throttling in the existing system has been known by all and correspondence has been sent to the end-users as well as discussed at the Broward County Consolidated Communications Committee (BCCCC) prior to incidents at Fort Lauderdale-Hollywood International Airport and Marjory Stoneman Douglas High School. Subsequently, efforts to educate continue (March 14, 2018, May 3, 2018, and now, May 23, 2018).

We strongly believe that once non first responders are removed from the system along with the higher processing power of the new P25 controller, coupled with end user training and disciplined usage protocols, we can significantly mitigate, if not totally eliminate, throttling from occurring.

### **Funding and Planning on the Replacement Regional Communications Systems**

The commitment demonstrated by the County Commission to regional public safety communications and related systems is reflected by the investments it has made, which exceeds \$140 million. This includes the replacement of major systems such as the Public Safety Radio, Computer Aided Dispatch (CAD), Fire Station Alerting, Viper 911 Phone, Local Government Radio, Alphanumeric Paging, and Text to 911 systems. These projects have been strategically planned and managed by subject matter experts with feedback from first responders, with the vision of providing state-of-art equipment that will benefit Broward County for many years to come.

### **Interoperability Between Systems**

Interoperability has been significantly increased through dispatch consolidation. Further enhancements are required such as standardized operational procedures and radio protocols, training (dispatch and field) and regional fleet maps. In addition, we encourage the Cities of Coral Springs and Plantation to the join the County's Computer Aided Dispatch (CAD) system as non-regional participants. This will allow them to maintain their independent dispatch center status; however, the common CAD will eliminate the need for call transfers and enable greater capabilities

for situational awareness across the PSAPs in the County. We encourage both the Police and Fire Chiefs' Associations to support and lead some of these efforts to further enhance interoperability.

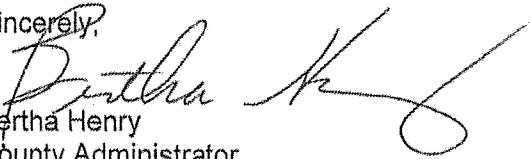

**Closest Unit Response**

The discussions on Closest Unit Response (CUR) began nearly 20 years ago, beginning with the Charter Review Committee. In 2002, the voters approved the charter amendment allowing for the implementation of CUR. For years, the County has invested millions and continues to fund mobile data terminals (MDTs) so that this life saving program can become a reality for our community. Unfortunately, CUR has not been accomplished even after a successful pilot was conducted to test the existing system capabilities. On a positive note, the County received the May 14, 2018 letter from the Fire Chief's Association proffering a guideline for a Closest Unit Response program. Although this is the first step of several, we appreciate your support and the County will be developing a project charter so that specific details can be approved by participating municipalities.

For your use, I have attached responses to your comments. We look forward to meeting your associations on May 23, 2018 to further discuss the implementation of the new P25 radio system and addressing concerns with the existing system.

If you have any questions, please contact me or Alphonso Jefferson, Jr., Assistant County Administrator, at 954-357-7352.

Sincerely,

  
Bertha Henry  
County Administrator

## Responses to Comments

**1. After Action Report** – All stake holders must be involved in the after-action report being prepared for the county. This way communications will be represented from an operational stand point and not just a technical stand point.

**Response:** *The After-Action Report that will be developed by the Police Foundation will include Motorola, MCP, ORCAT and end users. You have been designated as the point of contact for the end users and an invitation will be sent in the next day or so. The consultants will be conducting phone/skype interviews on May 30 and 31. If one day is better than the other for you, please let us know by May 25, 2018.*

**2. SmartZone system components** – specifically, the prime controller and site controller are no longer supported. As this has been identified as a prime area of concern (reference "throttling"), **Can we replace it immediately regardless of whether or not it is compatible with the new P25 system?**

**Response:** *There are no interim solutions available to replace the current controllers.*

**3. Maintenance of existing subscriber units** – Overall, this has been inconsistent causing them to affiliate to the system much more than normal; thereby affecting reliability and causing outages in the system controller. Has this been mitigated or resolved?

**Response:** *No. There continues to be agency subscriber units that are not properly maintained. Regularly, the County provides agencies with information on radios that require maintenance as they are identified to be operating outside of recommended performance standards. The maintenance responsibility for subscriber units resides with the end-user agencies and should have preventive maintenance at least once a year. As part of the new P25 radio system implementation, the County will be offering preventive maintenance services at a fee-based cost structure to municipalities or they can choose to use Motorola as our contract allows for a fee-based cost structure as well.*

**4. SmartZone capacity limit** – the system approaches capacity limit (more than desired) during peak usage hours (morning – evening), especially due to the number of users on the system (with school board usage being one of the identified users); **What can be done to reduce this usage to temporarily increase capacity until a permanent solution is in place?**

**Response:** *There are no options for increasing control channel capacity on the existing system. The system has the capacity (talkpaths) to handle the requested calls. The County is actively working to implement a UHF MotoTRBO system to migrate local government users off the public safety infrastructure. Completion of the MotoTRBO system is anticipated by 1st quarter of calendar year 2019. Transition of non-public safety users will occur following this timeframe.*

**5. Single points of failure** – MCP notes that this design can leave first responders with no way to communicate; **Have all options been exhausted to retrofit existing points of connectivity, site controller locations, and single site controllers to attempt to change this (even temporarily)?**

**Response:** *Yes. The new system has been carefully designed to ensure there are no single points of failure, including use of geographically redundant master sites and prime sites, and redundant network connections to each location. The ability to add additional site controllers is not available with the existing system. The most significant single point of failure in the current system is the prime controllers located at the Public Safety Building, due to age and control channel capacity. The system*

has redundant controllers to account for the failure of an individual controller. The other point of failure identified could potentially disable an individual radio site; but could not result in a complete system-wide outage.

**6. Subscriber Units** – At the time of the analysis, MCP estimates that 10,427 primary subscriber radios are currently on system; with additional estimates having another 3,000 to 4,000 subscriber radios programmed with the ability to access the system for interoperability; ***Is the new system designed for this level of capacity?***

**Response:** Yes. The new system was designed to handle loading for all existing users plus all first responder agencies in Broward County, including those operating on their own P25 digital systems (Fort Lauderdale, Coral Springs, and Plantation) and digital system (Hollywood). Based on Motorola's proposal, the primary simulcast cell can support up to 3,361 active users while maintaining a 1% grade of service, meaning with this number of users there is a 1% chance of a user receiving a busy (all talkpaths are in use). The new system also provides for a secondary "backup system" providing 12 simultaneous talkpaths, and 11 fixed conventional channels. Additionally, capacity will be improved by removing approximately 4,500 local government and school board users.

**7. Back-up** – Is there a plan to use Coral Springs and Plantation as true backups and vice versa?

**Response:** There is no current plan to utilize the Coral Springs, Plantation, or Fort Lauderdale systems as a backup to the countywide system as they do not provide the coverage or capacity to serve as a countywide backup. Individual departments are welcome to negotiate shared programming of talkgroups from these systems in a coordinated fashion to ensure these systems are not overloaded. The County is implementing a 7-channel backup system providing 12 available talkpaths and outdoor portable coverage from 4 transmitter locations. The County system has been designed with the coverage and capacity to serve as a backup for the Coral Springs, Plantation, Hollywood and Fort Lauderdale systems.

**8. In building coverage requirements** – have we established any guidelines regarding the use of additional BDA's, mobile and/or fixed repeaters, to help bridge the coverage gap? Has any contact been made with entities such as the Hospital District(s) or School Board regarding the issues within their buildings?

**Response:** Yes. Some hospitals have begun procurement of BDAs for their critical areas. We encourage School Board to evaluate the use of BDAs to improve radio coverage inside schools. The County advocated for and has adopted Section 118 to the Broward County building code regarding the use of "Two-way Radio Communication Enhanced Public Safety Signal Booster Systems" which went into effect April 15, 2016. The rules establish mandatory criteria for in-building public safety communications for new and existing buildings. While the new system will provide significantly improved in-building coverage, there is no guarantee that coverage will be provided in any specific building, and therefore BDAs should be implemented regardless. The County is supportive of agencies implementing vehicular repeater systems to provide another option for improving in-building coverage. The County intends to repurpose some of its 800 MHz channels for vehicular repeater usage once the existing system is decommissioned. There needs to be established detailed SOPs for these type of operations, to include recurring end user training.

**9. Static back up system for redundancy** – Is one being configured and if so, how? What is the status of the 4-RDSTFD locations related to the Region 7 700 MHz system? MCP recommended that the County proceed with implementing the RDSTF 700 MHz overlay system as a stand-alone trunked P25 Phase I location for backup capability – was the procurement of this system authorized and

completed prior to the end of 2015 (as recommended)? A fixed / dedicated solution was recommended to ensure immediate availability; with supplemental components such as mobile, conventional repeaters.

**Response:** *As previously noted, the County is implementing a 4-site 12-talkpath backup system with an independent controller. The County has already implemented one RDSTF location in east Broward County. While operational, the RDSTF sites are equipped with only 3 channels, providing a maximum of 2 simultaneous talkpaths, and thus providing limited capacity. As part of the P25 contract, the County procured a communications trailer that is equipped with both gateway equipment and two fixed conventional repeaters to support scene-of-incident response. While not yet operational, the County will explore options for deploying this resource prior to completion of the P25 system. In addition, the County is expanding the 3 8TAC channels to a 4-site simulcast configuration to provide improved coverage; and implementing 8 additional 700 MHz conventional interoperability channels. These resources can all be leveraged for backup scenarios.*

**10. Non public safety users** – are all non-public safety users being removed from the new 700 MHz frequencies?

**Response:** Yes.

**11. Future use of the 800 MHz frequencies** – will they still be available for use within the new system, regardless of whether or not the current design calls for its use? Would current and future tower sites be capable of housing/supporting both systems and the necessary equipment?

**Response:** *The County is exploring opportunities that would allow these licenses to be retained. Of the 28 frequencies utilized on the current system, 7 are licensed by the Broward County School Board, and thus the County does not have control over what ultimately happens to these resources.*

**12. End of life replacement schedule (pre-determined)** – MCP notes that even new equipment will have both predetermined and recommended end-of-life dates. Is there a plan in place to require the procurement and replacement of these pieces of equipment to ensure the new system does not suffer like the current one is in dealing with non-supported, non-functioning communication equipment?

**Response:** *The new system was procured with maintenance pricing for a System Upgrade Agreement (SUA) which includes the update of software and hardware every 2-years to keep the system current and replace any end-of-life components. It is the County's intent to execute this option on an ongoing basis. End user equipment will also need to be considered for continuous maintenance and end of support/life.*

**13. Microwave system status** – MCP recommended replacement of current system prior to the system cutover; what is the status?

**Response:** *The new Aviat microwave system is being implemented concurrently with the new P25 system. The design has been completed, the equipment has been staged, and delivered to a storage location inside Broward County prior to installation. The microwave system will be installed in parallel to the existing system to support a seamless cutover. The microwave system will be turned on and tested prior to the P25 system.*

**14. Paging system** – current system has a single controller resulting in a single point of failure. MCP recommends redundant controllers for new the system to mitigate this; is that recommendation being built into the newly designed paging system?

**Response:** *The new paging system has been equipped with geographically redundant controllers located at the Sunrise and Coconut Creek dispatch centers. The system has been operational since early 2017 and is currently undergoing project closeout activities.*

**15. Fort Lauderdale / Hollywood and their current system design with the newly proposed Regional Design** – MCP mentions the use of the current hosted master site and its interoperability with both Fort Lauderdale and Hollywood, including the Phase 1 subscriber units; is this still a concern and if so, how is it being handled?

**Response:** *This is no longer a concern. The new system will include an Inter-RF Sub System Interface (ISSI) to provide connectivity between the new County system and the Motorola Hosted Master site, which serves the systems utilized by Fort Lauderdale, Coral Springs, Plantation, and Hollywood. This connection will allow for the continued wire-line dispatch of Fort Lauderdale users at the County's regional dispatch centers, and shared console programming of talkgroups at all five PSAPs in the County. The County has advised all system users that Phase II radios are required to operate on the County system. In the beginning, Phase I compatible talkgroups will be required to be tightly controlled (only limited to mutual aid) and will eventually be completely Phase II (TDMA).*

**16. UHF frequency status for paging / station alerting** – have the identified frequencies been secured for these items?

**Response:** *Yes, a new UHF frequency was secured for both systems and has been utilized on the new paging system since early 2017. Fire station alerting is still in progress of being implemented.*

**17. Maintenance Plan** – MCP recommends a mandatory preventative maintenance program that requires a retune every other year for subscriber units to prevent issues in the system; how is that being handled and by whom?

**Response:** *Pricing was secured from Motorola for the recommended subscriber retune schedule. Since the end user subscriber units are the direct responsibility of each agency, each agency is accountable for complying with the recommended maintenance of all radios being used on the County's infrastructure on an annual basis. For the new system, a regional preventive maintenance standard will be established, implemented and tracked for all users that utilize the County's radio infrastructure.*

**18. Transition between current system to new system** - MCP mentions issues with Phase I vs Phase II subscribers regarding system capacity with Phase I subscribers using the system until the unit is changed to a Phase II compatible subscriber unit; is this still a concern and if so, how is it being handled?

**Response:** *This discussion revolved around system options that could allow for the prolonged use of Phase I radios on the County system. Based on the system deployment schedule and coterminous end-of-support dates for fielded XTS and XTL subscribers, the County elected to proceed with a system architecture designed for Phase II radio usage. Users have been advised that any Phase I radios will need to be replaced with Phase II enabled radios prior to system cutover. This was also reinforced during the December 6, 2017 and the March 14, 2018 subscriber meetings. Subscriber pricing was negotiated as part of the P25 system procurement, negotiated pricing discounts set to expire May 2019. Contract has been uploaded to the County's website.*

**19. Local Government System** - When will the local government system be ready? Is there a delay? If so, what is that delay?

**Response:** *The local government radio system is planned to be available by 1<sup>st</sup> quarter calendar year 2019. A delay in implementation occurred because the contracted vendor, Control Communications, declared bankruptcy. An emergency procurement was performed to reassign the system deployment to Radio One.*

**20. School Board** - If the school board users prove to be a problem, can they be off-loaded to a commercial system now? If not, why?

**Response:** *Recognizing only the School Board Police Department will be accommodated on the new P25 public safety radio system, they are pursuing an alternate solution to accommodate their non-public safety radio communication needs.*

**21. Talkgroups** - Are talkgroup priorities set in the new system to allow Main channels and tactical channels to connect?

**Response:** *Yes, talkgroup priorities will be set in the new system. In addition, talkgroup priorities are already defined and established on the existing system for public safety users. However, talkgroup priorities only come into play once the system has reached a busy state (all talkpaths are being used), and additional talkgroup requests are placed in a queue. Talkgroups with priority are automatically placed at the top of the queue. As an FYI, priorities have no bearing on scenarios involving "throttling" or control channel loading.*

**22. Design** - Did the design consultant consider a two or three controller system, North/South, Main/Tactical, Law/Fire or any other combination/consideration on the new system?

**Response:** *The consultant considered all available options, including designs using multiple controllers. The system, as planned, will utilize two controllers in a geographically redundant configuration to account for both equipment failures and loss-of-site failures. A split between two simulcast cells was considered (as noted in Option 1 in the report), but avoided due to operational limitations, including but not limited to the fact that such a split would potentially limit talkgroups to a limited coverage area (not countywide). Split simulcast cells result in reduced capacity when talkgroups carry across multiple simulcast cells, result in reduced spectrum efficiency, and require more equipment. The trunked backup system described above utilizes a separate controller that can, upon agreed to detailed SOP's, be utilized to offload traffic during critical incidents to limit the potential for overloading the control channel on the primary simulcast cell.*

**23. Compliance** - Does the new system comply with NFPA 1221 with regard to having non-trunked conventional or simplex channels for tactical operations? Non-trunked/conventional channels do not need a controller.

**Response:** *NFPA 1221 speaks to using analog conventional channels on the fire ground in the "direct" or "simplex" mode. Use of these channels is an operational decision and not dependent on the fixed system architecture. Currently, the FR regional fleetmap has a dedicated conventional resource for this operation, BCF-VRSD. In the past there were additional discussions of having vehicle repeaters as well. As like any operation, there needs to be a regional SOP on utilization of these systems and what frequencies they will utilize so there's no interference with the primary*

trunked system. In Broward County, the City of Fort Lauderdale, Coral Springs, and Plantation all currently utilize a digital P25 system for its public safety users.

**24. Training** - When will formal training be provided by the County for the end users?

**Response:** *Initial training will be conducted on May 23, 2018 to demonstrate again the user activity on the radio system. Following this initial training, County staff will be working with the Police and Fire Chiefs' Associations to establish a regional standardized training curriculum on best practices for radio operations. It was mentioned during the Commission meeting held on May 8, 2018 that Law and Fire have end user training. We are requesting each agency to provide their current radio training procedures and the frequency in which such training is conducted. Our goal is to have all radios users trained.*

**25. MDTs** - What is the replacement plan for the mobile data terminals?

**Response:** *The County understands the importance of having functional MDTs in the Fire/EMS front line units; and has programmed budget funding to support their repair or replacement, on an as needed basis. The County remains committed to replace units that are not repairable. The County has received the guidelines for Closest Unit response proposed by the Fire Chief's Association and will present these guidelines to the municipalities for approval. In the meantime, the County has committed to reimburse agencies that decide to purchase new front-line MDTs in advance, for amounts up to the County's costs of procuring Fire/EMS MDTs.*

**26. Tactical Communications Plan** - In the August 15, 2017 After Action Report "Active Shooter Incident and Post-Event Response January 6, 2017", issued by Broward County, Recommendation Item 1.1.1.5 states: "Consider developing a Tactical Communications Plan for first responders during high-volume events when radio and cell phones are busy, not working or overwhelmed." This is related, obviously, to the "throttling issue" briefly discussed therein. Can you please provide a copy of this plan.

**Response:** *We previously provided a response to this question in a series of emails in which you were copied indicating what was meant and understood by the Airport Leadership, Airport Consultant and ORCAT. We have offered to assist in developing a countywide tactical plan and have offered resources to do so. I am advised Fire Rescue developed regional consolidated fleet map in 2013, which we will need to be revised as well. In the meantime, we are gathering best practices to assist the operational teams with developing and/or modifying Standard Operational Procedures for Law and Fire and, absent a plan from operations, will implement these best practices as part of the new system. We are awaiting a response to our offer.*

**27. SOPs** – Please provide a copy of the County's current SOP on governing the use of the radio system.

**Response:** *Please refer to the Regional ILA's for the previous developed SOPs.*
